

History

In 2003 Swen Freeth, a specialist for laser welding plants and Detlef Voigt, an experienced graduated engineer and metallurgist, founded the company called quada V+F Laser Welding Wire as a civil law partnership (GbR). In the middle of 2005 quada V+F Laser welding Wire Ltd. (GmbH) was founded.

quada, as a separate enterprise, should clearly stand out above the usual suppliers of laser welding wires. This was to be achieved by having additional competence and a wide offer of services. The aim is to find an individual, technical and commercial solution for each and every customer.

As was expected, the service quality, the reliability as well as the optimised supply of wires led to success.

Today, quada V+F is well known and in demand especially as a problem solver in the branch of laser welding wires. Whether in Germany, Europe, Asia, Africa or America, the know-how has been well-proven especially for difficult tasks which demand solutions far from the normal mainstream answers.

Especially the individualised problem-solving-competence led to a full-service offer, which at the beginning of 2011 was re-defined and in the meantime, without exaggeration, is unique.
